                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CC The present invention relates to methods of detecting a prostate CC cancer-associated transcript in a cell from a patient. The method CC comprises contacting a biological sample from the patient with CC prostate cancer-associated polynucleotides (designated PC genes) that selectively hybridise to a sequence that is at least 80% identical CC to them. The prostate cancer associated polynucleotide sequences are differentially expressed in prostate tumour tissue or in prostate cancer and are derived from the tissues of various organisms such as humans or other mammals (e.g. mice, sheep and dogs). The methods of the invention are useful for diagnosing and treating prostate cancer in mammals. The prostate cancer associated genes are useful for diagnosing or treating prostate cancer, as well as for cancer in mammals. The prostate cancer well as for constate cancer. The nucleic acid sequences are particularly useful in gene therapy, as a vaccine or in antisense applications.

The invention relates to isolated prostate-specific polymucleotides, polypeptides, fusion proteins of the polypeptides, antibodies raised against the polypeptides (or antigenic epitopes derived from them) and antigen-presenting cells expressing the polypeptides. The antibodies are useful for detecting the presence of cancer, especially prostate cancer. The polypeptides, polymucleotides and the antigen-presenting cells are useful for stimulating and/or expanding T cells specific for a tumour protein, and for inhibiting the development of cancer especially prostate cancer. Compositions comprising the polymucleotide and/or polypeptide are useful for stimulating an immune response, and for treating cancer. The oligonucleotide is useful for detecting cancer. The present sequence is a prostate specific polymucleotide of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes polynucleotide sequences (I) which encode prostate-specific proteins (II). (II) and (II) have cytostatic activity, and can be used in vaccine production and gene therapy. (I), (II), antibodies to (II), fusion proteins comprising (II), and isolated T cells prepared using (I) or (II) are used treat cancer in a patient. (I) and the antibodies are also used in the detection of cancer in a patient. The cancer that is diagnosed or treated is particularly prostate cancer. (I) and (II) can be used in vaccines. The antibodies or (I) can be used for monitoring the progression of cancer in a patient. (I) and (II) can also be used to improve diagnostic and therapeutic methods for prostate cancer. They can indicate the level of metastasis as well as the prostate volume. AAH93357 to AAH93944 and AAM01115 to AAM01318 represent polynucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Xu J, Dil

CC The present invention describes primer sets for synthesising 5602 CC full-length cDNAs defined in the specification. Where a primer set CC comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of CC the 5602 nucleotide sequences defined in the specification, where the coligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the CC complementary strand of a polynucleotide which comprises a 5'-end CC sequence and an oligonucleotide comprises a 3'-end sequence complementary to a colynucleotide which comprises a 3'-end sequence complementary to a colynucleotide which comprises a 3'-end sequence, where the colynucleotide comprises at least 15 nucleotides and the combination of the 5'-end sequence'3'-end sequence is selected from those defined in CC the specification. The primers set useful for synthesising polynucleotides, and gene therapy. The primers are useful for synthesising polynucleotides, or particularly full-length cDNAs. The primers are also useful for the CC particularly full-length cDNAs. The primers allow obtaining of the full-length CDNAs and the protestar encoded by the full-length cDNAs. The primers allow obtaining of the full-length CDNAs easily without any specialised methods. AAH3363 to AAH13628 and CC AAH3633 to AAH18742 represent human acond sequences; and AAH13629 to AAH13632 represent invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ota T,

```

The invention describes a fusion protein comprising at least one amino acid sequence of immunogenic portions of any of the 3 sequences not defined in the specification, or sequences having at least 70 or 90 % sequence identity to any one of the 35 sequences defined in the USPTO web site, which is encoded by any of the 4 nucleotide sequences not defined in the specification. The fusion protein, composition and methods are useful for diagnosing, preventing and/or treating cancer, particularly prostate cancer. The proteins are useful as markers to indicate the presence or absence of cancer. This sequence represents a prostate cancer therapy associated cDNA.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the US patent office at seqdata.uspto.gov/sequence.html?DocID=US20020192763.

The GCRP polypeptides, polynucleotides, antibodies, antagonists and agonists may be administered to human patients for the diagnosis, treatment and prevention of nervous system disorders (e.g. epilepsy, stroke, neoplasms, Alzheimer's disease), autoimmune or inflammatory disorders, complications of cancer, hemadialysis and extracorporeal circulation, and cell proliferative disorders. They are also used to treat or prevent disorders associated with decreased or increased expression or activity of GCRP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel human G-protein coupled receptor proteins used in the diagnosis, treatment and prevention of nervous system disorders, autoimmune/inflammatory disorders, and cell proliferative disorders

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to isolated prostate-specific polymucleotides, polypeptides, fusion proteins of the polypeptides, antibodies raised against the polypeptides (or antigenic epitopes derived from them) and antigen-presenting cells expressing the polypeptides. The antibodies are useful for detecting the presence of cancer, especially prostate cancer. The polypeptides, polymucleotides and the antigen-presenting cells are useful for stimulating and/or expanding reells specific for a tumour protein, and for inhibiting the development of cancer especially prostate cancer. Compositions comprising the polymucleotide and/or polypeptide are useful for stimulating an immune response, and for treating cancer. The oligonucleotide is useful for detecting cancer. The present sequence is a prostate specific polymucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Fanger

                                                                                                                                                                                                                                                                                                                           뮍
                                                                                                                                                                                                                                                                                                                                                       δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes polynucleotide sequences (I) which encode CC prostate-specific proteins (II), (I) and (II) have cytostatic activity, CC and can be used in vaccine production and gene therapy. (I), (II), CC antibodies to.(II), fusion proteins comprising (II), and isolated CC antibodies to.(II), fusion proteins comprising (II), and isolated CC and the antibodies are also used in the detection of cancer in a patient. The cancer that is diagnosed or treated is particularly CC prostate cancer. (I) and (II) can be used in the detection of cancer in a CC patient. The used for monitoring the progression of cancer in a patient. (I) and (II) can also be used to improve diagnostic and therapeutic CC methods for prostate cancer. They can indicate the level of metastasis CC as well as the prostate volume. AAH93357 to AAH93944 and AAM01115 to CC exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                       Query Match

The fusion protein, composition and methods are useful for diagnosing, preventing and/or treating cancer, particularly prostate cancer. The proteins are useful as markers to indicate the presence or absence of cancer. This sequence indicate the prostate cancer therapy associated cDNA.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly seculate unit of the care them are the protein as the protein of the protein 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 1302 BP; 277 A; 346 C; 259 G; 420 T; 0 other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New fusion protein comprising prostate-specific polypeptides, or its immunogenic portions, useful for diagnosing, preventing and/or treating cancer, particularly prostate cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Example 15; SEQ ID NO 916; 85pp; English.

```
The invention relates to nucleic acid sequences (ABA81529-ABA81522) that CC (ABB44523-ABB44543). The isolated polypeptides CC (ABB44522-ABB44543). The isolated polypeptide having a sequence differing CC by no more than 15 % of amino acid residues from one of 22 amino acid CC sequences (or mature forms of the sequences) fully defined in the Specification and corresponding to human G-protein coupled receptor X (GPCRX) polypeptides. The polypeptides have potential cardiant, CC antiarteriosclerotic, anabolic, cytostatic and antiviral activity. The CC polypeptides can be administered therapeutically, especially using gene CC therapy and expressing the encoding DNA in vivo, to treat or prevent CC GPCRX-associated disorders, especially in humans. For example, they can be used to treat/prevent cardiomyopathy, atherosclerosis, disorders CC related to signal processing and metabolic pathway modulation (e.g. Cobsity, anorexia), diabetes, osteoporosis, Crohn's disease, multiple CC sclerosis, asthma, cancers, neurodegenerative disorders (e.g. Alzheimer's disease, parkinson's disorders, Huntington's disease, multiple CC sclerosis, asthma, cancers, neurodegenerative disorders (e.g. Alzheimer's haematopoietic disorders, developmental diseases, neurological disorders, contental fungal protozoal and viral infections (e.g. Alzheimer's haematopoietic disorders, developmental diseases, neurological disorders, bacterial, fungal, protozoal and viral infections (e.g. with human content levels of the polypeptide expression to a disease associated with altered levels of the polypeptide in mammals (especially humans) by detecting alterations in polypeptide expression levels relative to control samples. They are useful to identify agents binding polypeptide (e.g. cellular receptors or downstream effectors) and/or agents (CC e.g. cellular receptors or downstream effectors) and/or agents (CC e.g. cellular receptors or downstream effectors) and/or agents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    06-APR-2000;

New human G-protein coupled receptor X, GPCRX, polypeptide useful treatment or prevention of GPCRX associated disorders e.g. cardiomyopathy or atherosclerosis, and to screen for antagonists agonists useful therapeutically

Claim 9; Page 57; 157pp; English

The invention relates to nucleic acid sequences (ABA81529-ABA81522) that encode G-coupled protein-receptor related polypeptides CC (ABB44522-ABB4443). The isolated polypeptide having a sequence differing CC by no more than 15 % of amino acid residues from one of 22 amino acid sequences (or mature forms of the sequences), fully defined in the specification and corresponding to human G-protein coupled receptor X (GPCHX) polypeptides. The polypeptides have potential cardiant, CC antiarteriosclerotic, anabolic, cytostatic and antiviral activity. The CC polypeptides can be administered therapeutically, especially using gene CC therapy and expressing the encoding DNA in vivo, to treat or prevent CC GPCHX-associated disorders, especially in humans. For example, they can be used to treat/prevent cardiomyopathy, atherosclerosis, disorders (CC besity, anorexia), diabetes, osteoporosis, Crohn's disease, multiple CC disease, parkinson's disorders, neurodegenerative disorders (e.g. Alzheimer's CC disease, parkinson's disorders, neurodegenerative disease), immune disorders, bacterial, fungal, protozoal and viral infections (e.g. with human CC immunodeficiency virus (HIV)-1 or HIV-2). They can be used disgnostically to determine the presence of or predisposition to a disease associated with altered levels of the polypeptide in mammals (especially humans) by detecting alterations in polypeptide expression levels relative to control samples. They are useful to identify agents binding polypeptide (e.g. cellular receptors or downstream effectors) and/or agents
